

CARPOOL COPILOT

SAN FRANCISCO · 2026

The school carpool is **30+ moving parts every week** — coordinated today in WhatsApp chaos. Carpool Copilot runs the whole cycle end-to-end, and puts an agent parents actually trust in the loop.

LIVE TODAY — THE FULL WEEKLY CYCLE, AUTOMATED

No coordinator bottleneck — the weekly pipeline is fully cron-automated, and self-heals when life happens: volunteers, reassignments, and parents' own ad-hoc drives fill every gap.

8

straight weeks in live operation

321

drives generated & rostered

12 · 11

kids · households in the pilot crew

0

unaccounted seats — coverage is the product

THE AGENT IS USED, NOT DEMOED

Crewmate AI (the in-chat copilot) lives in the parents' own group chat. It answers schedule questions and proposes changes as consent cards:

- cancel a ride
- swap drives
- place a kid
- cover a gap
- add an extra drive

20 cards proposed → 11 executed by parents in 8 weeks. Every execution runs through the same

THE WEDGE GENERALIZES

- 1

ONE CREW · LIVE
The hard part isn't chat — it's seat-count invariants, shared-car rules, coverage accounting, and a trust boundary. Shipped, self-healing, proven on real school runs.
- 2

EVERY CREW
Self-serve group setup — the unit of value is a crew, not a school. Replicate across SF's ~50k schoolkids, one pickup spot at a time.
- 3

CITY LAYER
The copilot turns proactive: predicts Sunday coverage gaps and proposes fixes before the week starts; cross-crew route intelligence ("3 families near you also drive Wednesdays").
- 4

EVERY KID-TRANSPORT NETWORK
Camps, leagues, aftercare, daycares — same weekly-cycle engine, same consent cards. ~50M US schoolkids and their logistics.

Category: family-transport coordination, run by an agent.

Model: free consumer wedge → school / PTA + enrichment-program licensing at

WHY THIS IS HARD TO COPY

- Coverage invariants live in the executor, not the prompt
- Every action audited + fan-out notified to affected families
- Consent cards — nothing changes without a parent's OK
- The boring half — cron pipeline, roster truth, reminder mesh — is the moat

WHY NOW

Agents crossed the trust line in 2026: they negotiate in chat and execute inside invariant-enforcing transactions.
